Project Abstract Submission Form

Sec No-10	Team No-	Project Title-Media & Entertainment Mobile App for Subscriber Self-Service
------------------	-----------------	---

1. Abstract

The **Media & Entertainment Mobile App for Subscriber Self-Service** is a database-driven application designed to make it easier for subscribers to manage their entertainment services independently. In existing media platforms, users often depend on customer support for tasks such as checking subscription plans, renewing services, viewing payment details, updating profiles, and finding suitable content. The proposed solution provides a single mobile platform where users can manage their profiles, subscriptions, payments, and entertainment content. The backend database securely stores subscriber information, subscription details, payment transactions, content records, viewing history, and user preferences. Database concepts such as relational tables, primary and foreign keys, normalization, SQL queries, transactions, and data integrity are used to ensure efficient and reliable data management. The application can also provide personalized content recommendations and notifications for subscription expiry, payments, and new content. Overall, the project aims to reduce dependency on customer support, improve service efficiency, provide easy access to subscriber information, and deliver a convenient and personalized entertainment experience.

2. Team Details

3. Frameworks / Platforms / Software Used

The project can be developed using **Android Studio** as the main development platform, with **Java or Kotlin** for mobile application development. **XML** can be used for designing the mobile app interface. For the backend, **MySQL** can be used as the relational database to store subscriber details, subscription plans, payments, and entertainment content. **Firestore** can be used for user authentication and notifications if required. **Node.js with Express.js** can be used to create APIs that connect the mobile application with the database. **Postman** can be used to test backend APIs, while **Git and GitHub** can be used for source-code management and version control. **VS Code** can be used for backend development, and **Figma** can be used to design the mobile application's user interface.
